System Overview of the Simple Budget Planner Software

This simple, easy-to-use website/app has been created to assist users with organizing their personal finances. Many individuals struggle with controlling their spending or tracking how much money is spent. The Simple Budget Planner System provides users with a simple method to manage their income, expenses, and monthly budgets.

Users can add income from various sources, such as job-related income, allowance, or freelance work. Users can also input daily purchases into different categories (food, transportation, shopping, utilities). All transactions are stored and displayed in a manner that allows users to review their financial transactions at any time.

The system will automatically calculate the remaining balance after each transaction, which gives users instant awareness of their current financial position. Users also have the option to establish a monthly budget, and the system will notify users when they are nearing their monthly budget limit. This allows users to make better financial decisions to avoid overspending.

The Simple Budget Planner Software is designed in a very simple and clear manner and is easy for all user groups to operate, mainly students, employed individuals, and those who have limited knowledge related to personal finances. The Simple Budget Planner Software can be accessed via smartphones and computers for easy, convenient, and broad access to financial information.

System Architecture

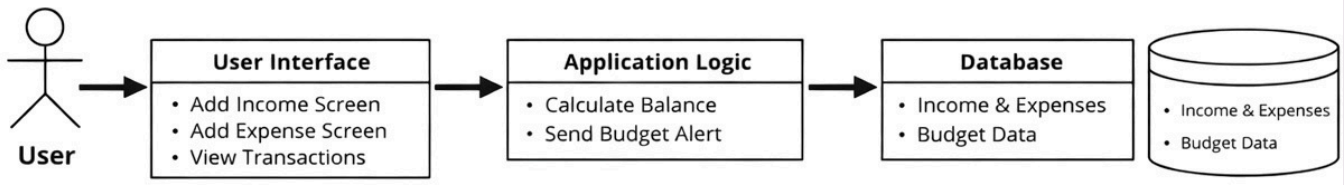

The system architecture of the Simple Budget Planner describes the internal structure of the application and how its main components interact. The system is organized into three primary layers:

1 - User Interface (UI)

2- Application Logic

3- Database

This layered architecture ensures clarity, maintainability, and smooth data flow throughout the system.

User interface wireframes

Description:
The user interface of the Simple Budget Planner is designed to be simple and easy to use, especially for beginner users. The system includes three main screens that allow users to manage their finances efficiently.
Users can easily move between screens using clear buttons and navigation options.

Screen 1: Home Screen
Description:
The Home screen provides an overview of the user's financial status.
Includes:

- Current Balance
- Quick summary of income and expenses
- Buttons to navigate to other features

Example Elements:

- "View Balance"
- "Add Income"
- "Add Expense"
- "View Transactions"

Screen 2: Add Income / Expense Screen
Description:
This screen allows users to add financial transactions.
Includes:

- Input field for amount
- Input field for source (income) or category (expense)
- Save button

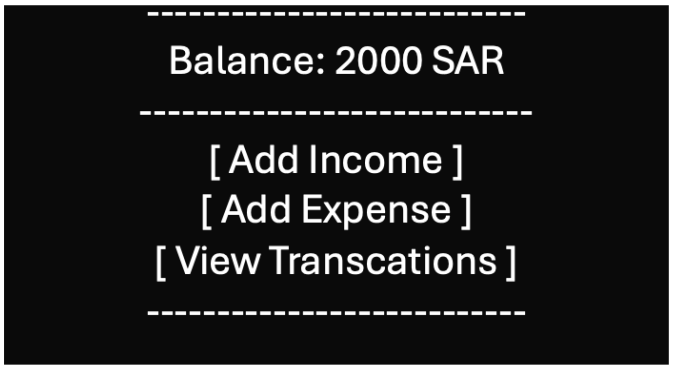

Purpose:
To quickly record daily financial activity.

Screen 3: Transactions Screen
Description:
This screen displays all user transactions.
Includes:

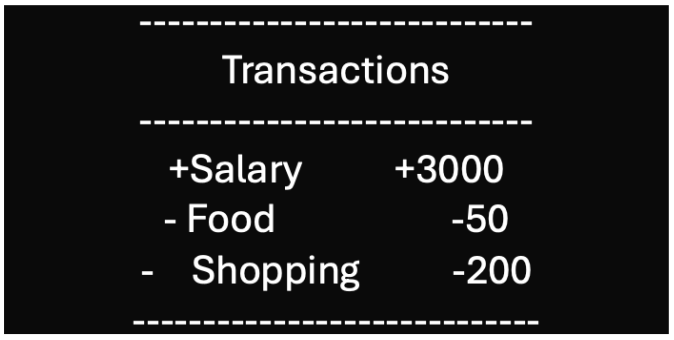

- List of income and expenses
- Date and amount for each transaction
- Clear and simple layout

Design Decisions

The design of the Simple Budget Planner system was chosen to be simple, clear, and easy to use for university students and young employees who need help managing their finances. The user interface uses a clean layout so users can quickly add income, record expenses, and check their balance without confusion. This supports the target users identified in earlier phases.

The system was divided into three main parts: User Interface, Application Logic, and Database. This separation makes the system easier to develop, maintain, and improve in the future. The User Interface handles user interaction, the Application Logic performs calculations such as updating balances and checking budgets, while the Database stores all transactions securely.

A mobile-friendly design was selected because many users prefer using smartphones to manage daily tasks. The system is also accessible on computers to provide flexibility for different users and devices.

Alerts and notifications were included in the design because they help users avoid overspending and stay within their monthly budget. This feature increases financial awareness and encourages better spending habits.

Basic authentication was selected to protect user data and privacy. Since the system is designed as a simple academic project, a basic login system is sufficient for the first version. More advanced security features can be added in future versions.

Finally, charts and summary reports were chosen to present financial information in a clear visual way. This helps users understand spending patterns and make better financial decisions.
